Introduction

WELCOME

Thank you for choosing the AdderLink XD150FX extender modules. Using fiber optic links, these compact modules allow you to transfer the multiple connections listed below up to 4 kilometers from a host computer (see *Transmission distances* on the right).

The high grade screening employed within the metal cased enclosures combined with the immunity from interference of the fiber optic links make the AdderLink XD150FX modules highly suitable for use in 'noisy' industrial environments.

AdderLink XD150FX extender modules provide support for:

- High quality single- or dual-link DVI digital video (up to 2560 x 2048 @60Hz),
- USB keyboard and mouse plus two other USB devices (up to USB 2.0),
- An RS232 serial device at speeds up to 115200 baud,
- Mono microphone,
- Stereo speakers,
- Line-level audio in/out connections.

The AdderLink XD150FX extender modules are totally transparent in operation, leaving you free to use your computer as though you're still sitting next to it.

Transmitter

XD150FX Transmitter module

Fiber optic link (up to 4km)

Receiver

XD150FX Receiver module

One dual-link DVI-D display
Four USB devices
One RS232 serial device
Stereo speakers plus microphone

Transmission distances

The choice of fiber used with the AdderLink XD150FX modules has a considerable effect on the distance over which operation can take place. Using multi-mode fiber you can achieve distances up to 400m (1,312 feet); whereas, by using single-mode fiber (and accompanying SFP modules), the achievable maximum distance is increased to 4km (2.5 miles):

Distance	Fiber type	Fiber color code	SFP module
70m	OM1 (TIA-492AAAA)	Orange	SFP-MM-LC-10G
150m	OM2 (TIA-492AAAB)	Orange	SFP-MM-LC-10G
380m	OM3 (TIA-492AAAC)	Aqua	SFP-MM-LC-10G
400m	OM4 (TIA-492AAAC)	Aqua	SFP-MM-LC-10G
4km	OS1 (TIA-492C000)	Yellow	SFP-SM-LC-10G
	OS2 (TIA-492E000)	Yellow	SFP-SM-LC-10G

Installation

LOCATIONS

Please consider the following important points when planning the position of the AdderLink XD150FX modules:

• Situate the transmitter module close to the system to which it will be connected and near to a source of mains power. Place the receiver module in similar close proximity to the peripherals that it will connect with, plus a source of mains power.

• Consult the precautions listed within the Safety information section.

• Connections do not need to be carried out in the order given within this guide, however, where possible connect the *power in* as a final step.

CONNECTIONS

Installation involves linking the AdderLink XD150FX Transmitter module to various ports on the host computer, while the AdderLink XD150FX Receiver module is attached to your peripherals:

6

Fiber optic link

Each pair of AdderLink XD150FX modules are supplied together with SFP fiber optic modules of your choice (single or multi-mode). The fiber optic cable used must match the SFP type and also be of a suitable type for the distance being covered. See see Transmission distances for details.

To make the fiber optic link

IMPORTANT: Ensure the power supply is off/disconnected before inserting or removing an SFP module.

1 Remove the SFP module from its protective packing and insert it fully into the empty slot on the AdderLink XD150FX. The XD150FX transmitter slot is located on the front panel; the XD150FX receiver slot is situated on the rear panel.

**Transmitter
front panel**

**Receiver
rear panel**

2 Repeat for the other SFP module on the other XD150FX.

3 For each SFP module, remove the black rubber insert that protects the sensors.

4 If fitted, remove the dual inserts that protect the fiber optic connector.
5 Insert the fiber optic connector into the SFP module so that it clicks into place.

**Transmitter
front panel**

**Receiver
rear panel**
6 Repeat steps 4 and 5 at the other end.
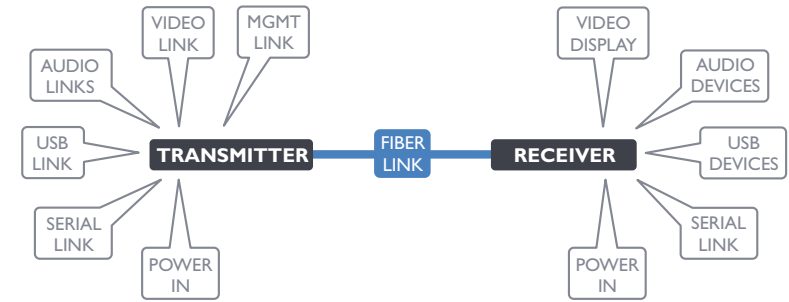

Note: In order to maintain a high level of confidence in the fiber optic link, the SFP's used must be those supplied by Adder: (SFP-MM-LC-10G or SFP-SM-LC-10G).

If alternative parts are used, the system will detect this and will flash the front panel LNK indicator.

To remove an SFP module

1 If fitted, remove the fiber optic connector from the SFP module (press down on the upper tab of the fiber optic connector to release it).

2 Unclip the small wire extraction lever and open it out (this action releases a locking tab and also provides a grip point).
3 Gently pull on the extraction lever to withdraw the SFP module from the slot.

4 If the SFP module and/or fiber optic connector will remain unused for any period of time, be sure to fit the protective inserts to keep the optical interfaces clean.

Transmitter video link

AdderLink XD150FX can support various high resolution video modes via the Dual-Link DVI-D port, see *Video resolutions* below for details.

To connect the video port

1 Connect the supplied digital video (plus USB) link cable between the DVI-D socket on the transmitter module rear panel and the DVI-D video output socket of the host computer.
From video output port on the host computer

Video resolutions

The XD150FX supports, but is not limited to, the following common video resolutions:

1920 x 1080 (HD)

1920 x 1200 (WUXGA)

2560 x 1080

2560 x 1440 (WQHD)

2560 x 1600 (WQXGA)

2560 x 2048 (QSXGA)

2048 x 2160

Transmitter audio links

The AdderLink XD150FX modules support stereo audio in and out connections. Where necessary, make connections between the audio input and/or output ports of the host computer and the transmitter module.

To connect the audio ports

1 For the line in and/or line out ports, connect the supplied audio link cable between the audio port on the transmitter module rear panel and the line in or line out socket of the host computer.

From the audio output on the host computer

To the audio input on the host computer
Transmitter USB link

The transmitter module requires a single USB connection to the host computer; this allows the receiver module to operate as a USB 2.0 hub with four ports.

To connect the USB port

1 Connect the type B connector of the supplied USB/video cable to the USB port on the rear panel of the transmitter module.
USB link from the host computer
2 Connect the type A connector of the cable to a vacant USB port on the host computer.

Transmitter serial link

The Options port provides an RS232 serial connection with the receiver module. When serial devices are attached to the Options ports on the transmitter and receiver modules, the units transparently convey the signals between them, via the fiber optic link, at rates up to 115200 baud - no serial configuration is required. An optional serial cable (part number: VSC45) is available from Adder.

To connect the serial port

1 Use the optional serial cable (VSC45) to link the Options port on the rear panel of the transmitter module with a vacant RS232 serial port on your host computer.
From the serial port of your host computer
Please see Appendix 1 for pin-out details of the Options port.

Transmitter management port link

The management port, located on the transmitter, allows the module to be connected to a standard Ethernet 10/100 network in order to allow remote monitoring and management functions to take place.

To connect the management port

1 Connect a standard CATx patch lead between the port on the rear panel of the transmitter module and a standard network switch.
From a standard network switch

By default, the IP address is set to **192.168.1.22**. If required, you can change the default IP address or alternatively, choose automated address selection by DHCP server. For details, please see the Configuration section.

Transmitter power connection

There is no on/off switch on either of the AdderLink XD150FX modules, so operation begins as soon as power is applied. The power adapters supplied with the modules use locking-type plugs to help prevent accidental disconnections; please follow the instructions shown on the right whenever disconnecting a power adapter.

AUDIO LINKS
VIDEO LINK
MGMT LINK
USB LINK
TRANSMITTER
FIBER LINK
SERIAL LINK
RECEIVER
POWER IN

To connect the power adapter

1 Attach the output plug of the supplied power adapter to the power input socket on the right side of the rear panel.

From the power adapter

2 Connect the IEC connector of the supplied country-specific power cord to the socket of the power adapter.

3 Connect the power cord to a nearby mains supply socket.

To disconnect the power adapter

1 Isolate the power adapter from the mains supply.

2 Grasp the outer body of the power adapter plug where it connects with the module.

3 Gently pull the body of the outer plug away from the module. As the body of the plug slides back, it will release from the socket and you can fully withdraw the whole plug.

Gently pull back the plug outer body to release the lock

IMPORTANT: Please read and adhere to the electrical safety information given within the Safety information section of this guide. In particular, do not use an unearthed power socket or extension cable.

Note: Both the modules and the power supplies generate heat when in operation and will become warm to the touch. Do not enclose them or place them in locations where air cannot circulate to cool the equipment. Do not operate the equipment in ambient temperatures exceeding 40 degrees Centigrade. Do not place the products in contact with equipment whose surface temperature exceeds 40 degrees Centigrade.

Receiver video display

A Dual-Link DVI-D port is provided on the rear panel of the receiver module. AdderLink XD150FX can support various high resolution video modes, see Video resolutions for details.

To connect the video display

1 Connect the DVI-D video cable from your video display to the video output port on the rear panel of the receiver module.

From your video display
EDID management

The EDID (Extended Display Identification Data) is read from the connected video display at the receiver module; it is then transferred to, and stored within, the transmitter module and then declared to the host computer. If the video display is removed then the cloned EDID stored at the transmitter module will still be presented to the video source.

Receiver audio devices

The AdderLink XD150FX receiver module can support multiple audio devices, such as stereo headphones, a mono microphone or line-level in/out connections.

To connect audio devices

1 Connect stereo headphones and/or a mono microphone to the 3.5mm jack audio sockets on the front panel of the receiver module.

From mono microphone

From stereo headphones
2 Optionally use the rear panel 3.5mm jack audio sockets to connect line-level in or out connections from audio devices, such as powered speakers.

From line out port of audio device

To line in port of audio device
Note: If the microphone port on the front panel is used, the module will disconnect the Line In port on the rear panel.

Receiver USB devices

The receiver module contains a USB hub that can support up to four v2.0 or v1.1 USB devices (in any combination). All four USB sockets are identical in operation.
To connect USB devices

1 Connect your USB keyboard, mouse and any other two USB devices to the four sockets distributed on the front and rear panels of the receiver module.

Rear panel

From USB devices

Front panel

From USB devices
Receiver serial link

The Options port provides an RS232 serial connection with the transmitter module. When serial devices are attached to the Options ports on the transmitter and receiver modules, the units transparently convey the signals between them, via the fiber optic link, at rates up to 115200 baud - no serial configuration is required. An optional serial cable (part number: VSC45) is available from Adder.
To connect the serial port

1 Use the optional serial cable (VSC45) to link the Options port on the rear panel of the receiver module with your RS232 serial device.

From your serial device
Please see Appendix 1 for pin-out details of the Options port.

Receiver power connection

There is no on/off switch on either of the AdderLink XD150FX modules, so operation begins as soon as power is applied. The power adapters supplied with the modules use locking-type plugs to help prevent accidental disconnections; please follow the instructions shown on the right whenever disconnecting a power adapter.

To connect the power adapter

1 Attach the output plug of the supplied power adapter to the power input socket on the right side of the rear panel.

From the power adapter

2 Connect the IEC connector of the supplied country-specific power cord to the socket of the power adapter.

3 Connect the power cord to a nearby mains supply socket.

To disconnect the power adapter

1 Isolate the power adapter from the mains supply.

2 Grasp the outer body of the power adapter plug where it connects with the module.

3 Gently pull the body of the outer plug away from the module. As the body of the plug slides back, it will release from the socket and you can fully withdraw the whole plug.

Gently pull back the plug outer body to release the lock

IMPORTANT: Please read and adhere to the electrical safety information given within the Safety information section of this guide. In particular, do not use an unearthed power socket or extension cable.

Note: Both the modules and the power supplies generate heat when in operation and will become warm to the touch. Do not enclose them or place them in locations where air cannot circulate to cool the equipment. Do not operate the equipment in ambient temperatures exceeding 40 degrees Centigrade. Do not place the products in contact with equipment whose surface temperature exceeds 40 degrees Centigrade.

Configuration

ACCESSING THE MANAGEMENT APPLICATION

AdderLink XD150FX modules generally configure themselves automatically, collecting EDID information from the attached monitor and passing it to the host computer. In most cases the modules will begin working together correctly as soon as they are connected. Where configuration changes are required (or remote monitoring is required), the management application provides an intuitive user interface.

To access the management application

1 Use a computer that is directly or indirectly (i.e. via a network switch) connected to the XD150FX transmitter module. If you need to make a temporary connection, see right ➥

2 Run a web browser on your computer and enter the IP address of the transmitter module. By default, the IP address is set to **192.168.1.22**. If required, you can change the default IP address or alternatively, choose automated address selection by DHCP server. See the Configure page.

3 If requested, enter the registered password to log on.

   Note: The default user and password are 'admin' and 'password' respectively.

   The Dashboard page should be displayed ➥

   The Dashboard page shows a real-time representation of the XD150FX installation.

   Use the menu on the left side to display other pages.

   Use the *Online Support* option to make contact with Adder through the main website.
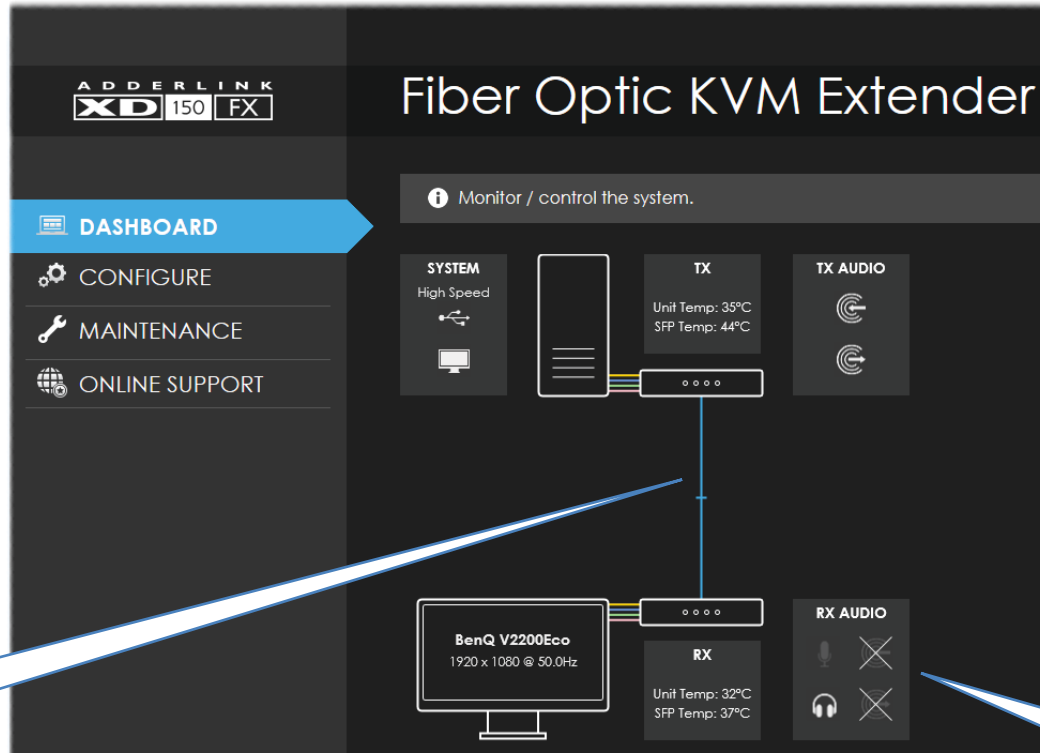

A lost fiber link is shown by a broken red line.

Update

Controls

All peripheral feeds are enabled by default. However, this section allows each feed to be disabled as required.

- *Disable High-speed USB* - this option needs to be ticked when connecting to Adder CCS-PRO8 devices.

Network

- *Obtain IP Address automatically (DHCP)* - When ticked, the transmitter module will use the DHCP (Dynamic Host Configuration Protocol) to automatically determine all network settings. When DHCP is used, the next three options are not manually editable.
- *IP Address* - set the IP address for the module.
- *Netmask* - set a subnet mask to accompany the IP address.
- *Gateway* - optionally define a suitable address for a gateway device.
- *MAC Address* - displays the unique (and fixed) MAC address for the module.
- *SSDP Name* - optionally add an identifier for this module.
- *Log-in Required* - when ticked, you will be requested to enter a user name and password.
- *Password for user 'admin'* - define a password here to be used when the 'Log In Required' option above is ticked.

  Note: The default user name and password are 'admin' and 'password' respectively.

Once changes are made, click the Update button to apply them.

The Maintenance page

The Maintenance page contains numerous features used for monitoring, restarting and upgrading the modules.

Transmitter and receiver details

These twin sections list numerous details for each module:

- Firmware, hardware and SFP (optical module) versions.
- Unit (main circuit board) and SFP (optical module) temperatures.
- Up-time.
- *EDID* - lists the currently registered video monitor, together with its serial number and a full raw hex listing of the declared EDID signature.
- *Identify* - Click the *Flash LED* button to flash the front panel indicators of the chosen module. Click once for five flashes, twice for indefinite flashing and a third time to stop the flashing.
- *Restart* - If a module becomes unresponsive, click the relevant *Restart* button to reboot the required module.

Factory Reset

Click this button to perform a full factory reset on both modules. All settings will be returned to their default values; the transmitter module will default to use the IP address of **192.168.1.22**.

Link Quality Test

This section tests and displays the quality of the data link between the two modules.

Firmware Upgrade

Use this section to perform a firmware upgrade on both modules using files available on request from Adder technical support.

Note: Firmware upgrades must be performed in pairs, i.e. the transmitter and receiver together. If one of the modules is not connected, the upgrade will not be carried out.

Download the API description

Click here to view the API description in *YAML* format.

Operation

The AdderLink XD150FX modules are designed to be transparent in operation; all peripherals should respond exactly as they would when situated next to your host computer.

INDICATORS
The transmitter and receiver modules contain various indicators to provide you with status information. Both modules have four red indicators on their front panels.
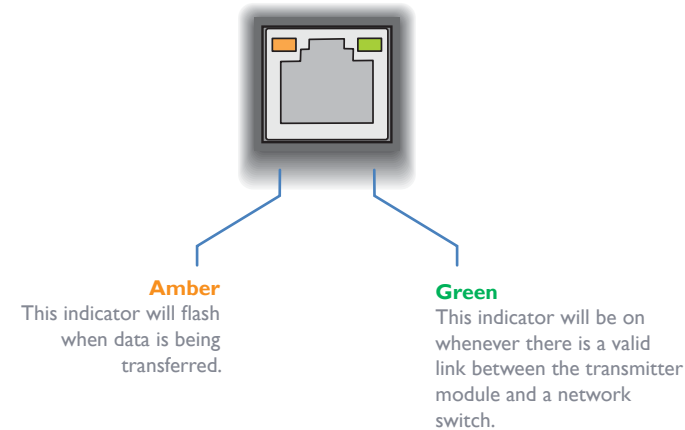

Red status indicators
The red status indicators on the front panels of each module mostly behave in the same manner at the same time:

LNK USB VID PWR

LNK

This indicator will be on once the link between the transmitter and receiver modules is established.

Flashes to warn that a non-approved SFP module has been fitted.

USB

This indicator will be on once the USB extender and hub located within the receiver module have been successfully enumerated by the USB host on your computer.

Flashes to indicate the USB system has entered *suspend* mode. Ensure that one or more USB devices are attached to the receiver module and a valid USB link is made between the transmitter module and the host computer.

VID

This indicator will be on (on both modules) when a valid video signal is detected.

PWR

This indicator will be on when power is supplied to each module.
Green and amber status indicators (transmitter module only)
The green and amber status indicators on the network management port connector of the transmitter module (rear panel) provide further status information:

Amber
This indicator will flash when data is being transferred.

Green
This indicator will be on whenever there is a valid link between the transmitter module and a network switch.

RESETTING A MODULE

On the left side of the front panel of each module, you will find a small hole which is used to invoke special functions. Use a thin implement, such as a straightened paperclip to press and hold the button concealed behind the smaller hole. Depending on when you release the button, the module will either perform a normal reset or completely reset itself to factory defaults:

Time (seconds):	0	5	10	15 . . . . .
Indicator(s):	PWR: On	All: Alternate flashing	All: Rapid flashing together	All: Normal
Release button for:	*Normal restart*	*Special configuration option (not currently used)*	*Reset to factory defaults*	*Return to normal operation*

Further information

This chapter contains a variety of information, including the following:

- Getting assistance - see right
- Appendix 1 - Options port pin-out
- Appendix 2 - Open source licenses
APPENDIX 1 - OPTIONS PORT PIN-OUT

The **OPTIONS** port uses a 6p6c socket. The pin-out is listed below.

Note: Although the pin labeled 'Not used' is inactive, it is still connected internally and so no links should be made at all to this pin.

Pin	Signal	Direction
1	CTS1 / RXD2	*Input to the module*
2	RXD1	*Input to the module*
3	TXD1	*Output from the module*
4	RTS1 / TXD2	*Output from the module*
5	Not used	
6	GND	*Reference for all signals*
